Education

D.J.Sanghvi College of Engineering, Mumbai 2023-2027
B.Tech in Artificial Intelligence(AI) and Data Science CGPA – 9.31

Jiten Mody Junior College, Mumbai 2021-2023
Higher Secondary School Certificate Percentage – 86.00%
MHT-CET Percentile – 99.65

Skills

Programming: Python, SQL, Java, HTML, CSS
Machine Learning: Deep Learning, Computer Vision (YOLOv8), NLP
Frameworks/Libraries: TensorFlow, PyTorch, Scikit-learn, Hugging Face, LangChain, FastAPI
Data: Pandas, NumPy, Data Cleaning, Visualization
Tools: Git, Docker, REST APIs
Databases: MySQL, MongoDB

Projects

VC Intelligence – *Python (FastAPI), Groq, yfinance, Chart.js, Vanilla JS, Tavily Search*

- Developed an AI-powered platform that automates end-to-end startup due diligence by generating investment recommendations, risk assessments, and investor reports.
- Implemented using FastAPI and Groq's Llama-3.3-70B, integrating real-time financial data (Yahoo Finance) and building interactive dashboards with Chart.js for dynamic financial visualization.
- Achieved **~95% reduction in manual research time**, delivering explainable insights with confidence scores, 5-category risk analysis, and 5-year financial projections (Bear/Base/Bull scenarios).

Suspicious Activity Detection – *Python, YOLOv11 (Ultralytics), XGBoost, OpenCV, Pandas, NumPy*

- Built a real-time suspicious activity detection system that monitors video feeds, identifies individuals exhibiting suspicious behavior, and applies selective blurring while classifying actions as normal or suspicious.
- Implemented using YOLOv11 pose estimation and XGBoost, extracting per-frame human keypoints, engineering structured features, and enabling real-time processing with OpenCV for detection, tracking, and video manipulation.
- Achieved ~92% classification accuracy with **~30 FPS real-time processing**, enabling per-person tracking and selective privacy masking, reducing manual surveillance **effort by ~80%.**

Smart Parking Scanner – *Python, YOLOv8 (Ultralytics), OpenCV, cvzone, Pandas, NumPy, Pickle*

- Built a real-time smart parking management system that detects vehicles from live video feeds, tracks occupancy across user-defined parking slots, and displays live counts of occupied and available spaces without requiring physical sensors.
- Implemented using YOLOv8 and OpenCV, designing a two-stage pipeline with a custom polygon annotation tool for defining parking zones and a detection module that processes frames, computes vehicle centroids, and determines slot occupancy using geometric mapping.
- Achieved **~95% vehicle detection accuracy** with ~25–30 FPS processing, enabling real-time occupancy tracking across multiple slots and reducing manual monitoring **effort by ~85%** while remaining adaptable to any parking layout without retraining.

Additional Skills

- Solved **175+ DSA problems** (Top 9%), strong in DP, Graphs, Trees, and optimization techniques
- Proficient in **core algorithmic patterns** (Sliding Window, Two Pointers, Binary Search, Prefix Sum)
- Experienced with advanced data structures and real-world problem-solving approaches
